<sup>1</sup> Oracle's Letter to the EU Concerning MySQL

After an antitrust investigation, the European Commission approved Oracle's acquisition of Sun Microsystems, including MySQL, on 21 January 2010.

Wikileaks subsequently published cables indicating that the Obama administration applied pressure to the EU to approve the deal.

Concerns about the MySQL acquisition had been addressed in Oracle's 14 December 2009 pledges to customers, which were to extend for five years — thus expiring in early 2015.

Oracle's pledges included commitments to maintain certain APIs, extensions of licenses to then-current licensees, continued use of GPL licensing, and others. The expiration of these commitments may change the nature of Oracle's relationships with a number of hardware and software vendors, as well as its posture regarding product investment, support for purchasing requirements, and other aspects of MySQL's business model.

# Help Save MySQL !

- 별다른 일이 없는 한 유럽위원회(EU)는 오는 2010년 1월 27일 이번 합병을 승인하는 결정을 내릴 예정이다. 지난 달 오라클이 향후 **최소 5년 간 MySQL**을 오라클의 핵심 데이터베이스 제품에 대해 독립적인 오픈소스 데이터베이스 경쟁제품으로 **보호**하겠다는 약속을 하면서 유럽위원회의가 양사의 합병을 인정하는 쪽으로 방향을 잡게 됐다. 하지만 오라클의 이런 약속은 유럽위원회가 강제하는 것이 아니라 민사소송을 제기해야 한다.
- 와이드니어스는 유럽위원회(EU)가 **책임을 면하기 위해** MySQL의 보호자 역할을 포기했다고 주장했다. 와이드니어스는 “오라클이 아무런 조건없이 MySQL을 손에 넣는다면, 유럽인으로써 우리의 규제 시스템이 부끄럽다고 할 수밖에 없다”고 비난했다.

Microseconds Precision	X	O	O	O

URL : <https://mariadb.com/blog/mysql-56-vs-mariadb-100>

▪ MariaDB 10.0.0 is still alpha with some of the features still under development.

▪ OpenSUSE and Fedora plan to replace MySQL with MariaDB in their corresponding distributions, but that's not because of the technical capabilities of MySQL.

# Magic Quadrant for Operational Database Management Systems

## Strengths

- **Rich functionality** : MariaDB offers multiple storage engines, tunable persistence, ACID support with the InnoDB/XtraDB engine, graph storage with Open Query Graph (OQGraph), and support for Apache Cassandra and JSON.
- **Value** : In our survey of reference customers, MariaDB received one of the three highest scores for value for money, as it did for suitability of pricing method. It also received one of the highest scores for "no problems encountered."
- **Strong community and partner network** : MariaDB is at the heart of a vibrant MySQL user community and ecosystem. It partners with Linux distribution vendors, IBM, Fusion-io, and organizations offering products for special-purpose storage engines, management, backup and HA, as well as service providers.

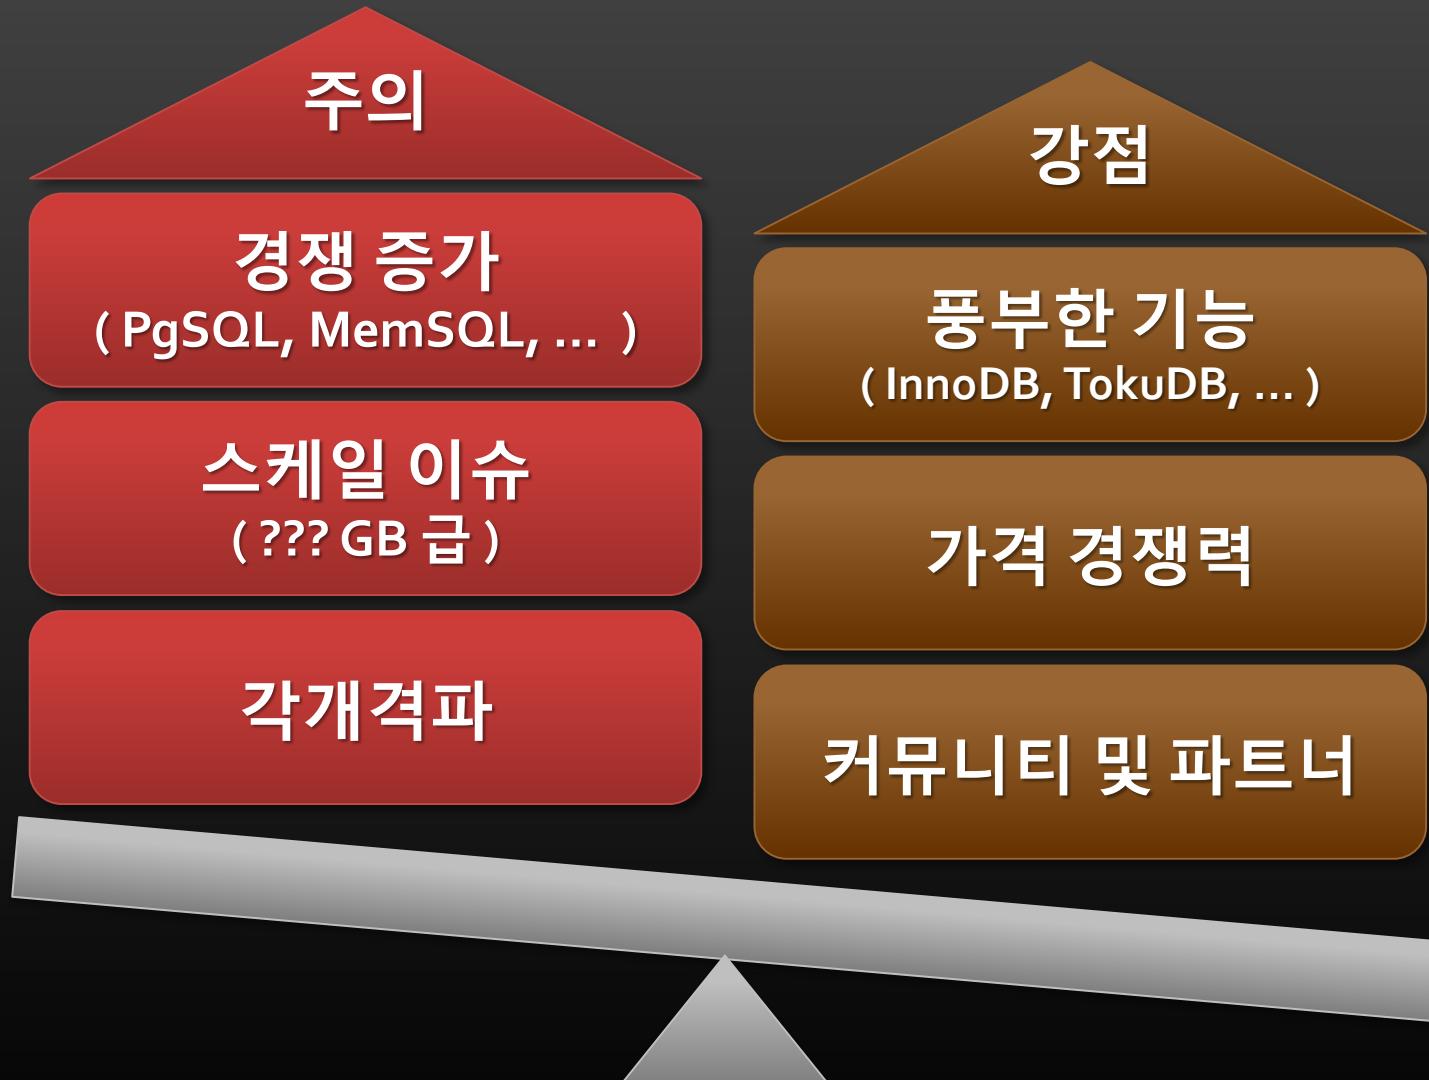

## Cautions

- **Increased competition** : MariaDB is increasingly visible and will face more competition, especially as Oracle's consent decree with the **EU regarding MySQL expires in 2015<sup>1</sup>** and **Oracle** becomes more aggressive.
- **Scale** : MariaDB's reference customers mostly quantified the size of their largest databases as being a few hundred gigabytes at most. To compete at the high end against increasing competition, MariaDB will require more terabyte-size reference customers.
- **Fragmented offerings** : Several customers remarked on the number of separate pieces in MariaDB's software stack; one noted there are "too many independent tools for managing databases."

URL : <http://readwrite.com/2013/07/01/salesforcecom-abandoning-its-postgres-flirtation#awesm=~od3Xo3LdsHXoCv>

# Magic Quadrant for Operational Database Management Systems

## Strengths

- **Community leadership** : EnterpriseDB is the primary contributor to the PostgreSQL community. It is responsible for many of the new features of PostgreSQL by contributing to JSON, materialized views and partitioning.
- **Functionality** : Gartner clients report that the functionality of EnterpriseDB's Postgres Plus Oracle Compatibility Feature is now more than sufficient to run both mission-critical and non-mission-critical applications. Recently, Infor, a major application platform independent software vendor (ISV), added EnterpriseDB as a DBMS platform choice.
- **Stability and compatibility** : Reference customers commend the compatibility with Oracle, the stability of the DBMS and the product support.

## Cautions

- **Open-source dilemma** : EnterpriseDB must conform to community-led release cycles for its community editions as they go through the open-source process. This can slow the process of enhancing the base open-source product, but not the enterprise edition.
- **Market exposure** : EnterpriseDB lacks breadth in its sales and marketing operations, which restricts its ability to communicate its message to potential enterprise customers. According to our survey, those that did not choose EnterpriseDB would have been more likely to choose it if they had been more familiar with it.
- **Support and documentation** : Reference customers reported a lack of local-language support and weak documentation.

# ORACLE®

## Korean Telecom Giant KT Corporation Steps up its Cooperation with EnterpriseDB on their Open Source-based Database Solutions

Release Date:

Apr 18, 2012

*KT Corp. concludes a one-year evaluation of Postgres Plus Advanced Server, eyeing to replace proprietary databases with a new standard*

BEDFORD, Mass. – April 18, 2012 – Enterprise DB, the leading worldwide provider of PostgreSQL and Oracle compatibility products and services, today announced a partnership with KT Corporation (NYSE: KT). The partnership will deepen the two companies' cooperation related to the deployment of Postgres Plus Advanced Server (PPAS) for non-mission critical needs, and will gradually expand the use of PPAS for mission critical deployments within KT.

The largest telecommunications provider in South Korea with a market cap of \$8.7 billion, KT is specifically seeking to deploy open source-based database management products to replace its current databases, representing one of the largest migrations from proprietary databases onto such a new standard. KT and EnterpriseDB intend to partner in promoting the use of [Postgres Plus Advanced Server](#) throughout KT's network of services.

"Integrated telecommunications providers worldwide are increasingly in the business of selling technology solutions and they're seeking innovative new ways to offer services at a lower cost," Ed Boyajian, President and CEO of EnterpriseDB, said. "PostgresPlus is enterprise-class at a fraction of the cost of traditional databases so we've become the most attractive database solution for mission and non-mission critical deployments."

KT is the largest telephone and broadband services provider in Korea. KT also provides enterprise IT services, including consulting and systems integration. The company's newest enterprise services leverage data stored in a cloud system.

"We made a careful and detailed evaluation of the Postgres Plus Advanced Server by EnterpriseDB and determined the solution makes much better business sense than our continuing with the expense of current software,"

Jae-Ho Jang, Ph.D., Senior Vice President, IT Strategy BU, KT Corporation, said. "We are looking forward to a rewarding partnership with EnterpriseDB as we continue to expand our services and increase the demands on our database."

# LINE

In summary, LINE storage layer is currently constructed as the follows:

- Standalone Redis: asynchronous job and message queuing
  - Redis queue and queue dispatcher are running together on each application server.
- Sharded Redis: front-end cache for data with  $O(n*t)$  and primary storage with  $O(n)$
- Backup MySQL: secondary storage (for backup, statistics)
- HBase: primary storage for data with  $O(n*t)$ 
  - We assume to operate hundreds of terabytes of data on each cluster with 100s to 1000 servers.

LINE main storage is constructed from about 600 nodes and continues to increase month after month.
